

Assignment -1

To-Do List Management System

****Student:**** _____

****Date:**** _____

****GitHub Repository:**** <https://github.com/kartikm95-2006/taskline-to-do-list>

1. Project Overview

Taskline is a browser-based To-Do List Management System. Users can add tasks, mark tasks completed, filter tasks, delete tasks, and see completion progress.

2. Jira Scrum Project

User stories

- ****Add Task:**** As a user, I want to add a new task to my To-Do List so that I can keep track of my work.
- ****Complete Task:**** As a user, I want to mark a task as completed so that I can identify the tasks I have finished.

****Jira Project:**** To-Do List Management System (`TODO`)

****Issues:**** `TODO-1` Add Task and `TODO-2` Complete Task

****Sprint:**** To-Do Sprint 1

****Workflow:**** To Do -> In Progress -> Done

Evidence

Jira project screenshot: To-Do List Management System (`TODO`).

****Explanation:**** This screenshot shows the Scrum project and its project navigation. The project key `TODO` identifies the Jira space used for the assignment.

Product Backlog screenshot: `TODO-1` and `TODO-2`.

****Explanation:**** The two requested user stories were created as `TODO-1 Add Task` and `TODO-2 Complete Task`. Both were moved into `To-Do Sprint 1`.

Sprint Backlog screenshot: To-Do Sprint 1.

****Explanation:**** Jira shows `To-Do Sprint 1` containing two work items, with the separate backlog empty. This verifies that both stories entered the Sprint Backlog.

Started sprint screenshot: To-Do Sprint 1.

****Explanation:**** The sprint is active for 7 Sep to 21 Sep and Jira provides the Complete sprint action. This confirms that the sprint was started.

In Progress evidence: Jira issue history/status transition.

****Explanation:**** Each story was progressed through the requested workflow from To Do to In Progress before completion. The final sprint board records both issues as Done.

Done screenshot: To-Do Sprint 1 board.

****Explanation:**** Jira shows `TODO-1` and `TODO-2` with status Done, completing the requested workflow for both user stories.

3. Git Operations

Command Purpose

--- ---

`git init` Initializes a new local Git repository.

`git status` Displays the current working-tree state.

`git add .` Stages all project files for commit.

`git commit -m "Initial commit"` Records the staged files in repository history.

`git branch feature-task` Creates a feature branch.

`git checkout feature-task` Switches to the feature branch.

`git checkout main` Switches back to the main branch.

`git merge feature-task` Merges the feature branch into main.

`git remote add origin <GitHub-URL>` Connects the local repository to GitHub.

`git push -u origin main` Publishes the main branch and sets its upstream.

Evidence

Insert terminal screenshot: git init.

****Explanation:**** The terminal confirms that the local repository was initialized successfully.

Insert terminal screenshot: add and commit.

****Explanation:**** The project files were staged and recorded in the initial commit.

Insert terminal screenshot: branch creation.

****Explanation:**** The feature-task branch was created and checked out for isolated work.

Insert terminal screenshot: merge.

****Explanation:**** The feature branch was merged into main, bringing its changes into the main line.

GitHub repository screenshot: <https://github.com/kartikm95-2006/taskline-to-do-list>.

****Explanation:**** The GitHub website displays the published `taskline-to-do-list` repository under `kartikm95-2006`, including the project files and workflow.

Terminal push evidence.

****Explanation:**** The push output confirms that local `main` was uploaded to `origin/main` at the GitHub repository URL above.

4. GitHub Actions

The workflow file is `.github/workflows/workflow.yml`:

```
name: Validate To-Do List

on:
  push:
    branches: [ main ]
  workflow_dispatch:
permissions:
```

```
    contents: read

jobs:
  validate:
    runs-on: ubuntu-latest
    steps:
      - name: Check out repository
        uses: actions/checkout@v4
      - name: Validate project files
        run: |
          test -f index.html
          test -f style.css
          test -f script.js
          grep -q "Taskline" index.html
          grep -q "taskForm" script.js
          echo "To-Do List project validation passed"
```

Insert GitHub Actions YAML screenshot.

****Explanation:**** The workflow runs automatically on every push to main and also supports manual execution.

Successful GitHub Actions run screenshot.

****Explanation:**** GitHub Actions shows a green successful run for `Validate To-Do List #1` on `main`, triggered by commit `c60b732`. The run validates all required project files.

5. Conclusion

The To-Do List Management System was planned in Jira, implemented as a Git project, merged through a feature branch, published to GitHub, and verified automatically with GitHub Actions.
